1	Introduction	
1.1	General	1
1.2	Scope of the report	1
1.3	Advantages and disadvantages of incorporating precast and prestressed concrete in construction	1
1.4	Performance criteria	2
1.5	State of precast construction practice (1.5.1 Canada – 1.5.2 Chile – 1.5.3 Italy – 1.5.4 Japan – 1.5.5 Mexico – 1.5.6 New Zealand – 1.5.7 United States of America)	3
1.6	Design approaches (1.6.1 Canada – 1.6.2 Chile – 1.6.3 Italy – 1.6.4 Japan – 1.6.5 Mexico – 1.6.6 New Zealand – 1.6.7 United States of America)	7
1.7	Acceptance procedures (1.7.1 Japan – 1.7.2 New Zealand – 1.7.3 United States of America)	15
	References	17
2	Lessons from previous earthquakes	
2.1	Introduction	19
2.2	Performance of well-designed, well detailed precast and prestressed concrete structures	19
2.3	Improper design and detailing of ductile elements	20
2.4	Inadequate diaphragm action	25
2.5	Poor joint and connection details	27
2.6	Inadequate separation of non-structural elements	32
2.7	Inadequate separation between structures	33
	References	33
3	Precast construction concepts	
3.1	Types of elements in structural systems incorporating precast concrete (3.1.1 Introduction – 3.1.2 Precast concrete floor units – 3.1.3 Precast beams – 3.1.4 Precast columns – 3.1.5 Combined beam-column systems – 3.1.6 Precast structural walls)	35
3.2	Types of connections between precast concrete elements in moment resisting frames and structural walls (3.2.1 General – 3.2.2 Equivalent monolithic systems – 3.2.3 Jointed systems)	39
3.3	Tolerances, fabrication and erection issues (3.3.1 Introduction – 3.3.2 Tolerances – 3.3.3 Fabrication – 3.3.4 Erection of seismic resistant precast structures)	42
3.4	Materials and quality assurance (3.4.1 Introduction – 3.4.2 Grouted connections – 3.4.3 Welded connections – 3.4.4 Bolted connections – 3.4.5 Post-tensioned connections – 3.4.6 Cast-in-place concrete connections)	44
3.5	Serviceability considerations (3.5.1 Introduction – 3.5.2 Temperature effects – 3.5.3 Creep and shrinkage – 3.5.4 Durability – 3.5.5 Fire and acoustic performance)	46
	References	47

4	Design approaches	
4.1	Performance objectives and limit states (4.1.1 General – 4.1.2 Structural performance levels – 4.1.3 Non-structural performance levels – 4.1.4 Parameters and response measures associated with performance)	49
4.2	Representation of ground motion (4.2.1 General – 4.2.2 Earthquake response spectra – 4.2.3 Earthquake time-history records)	52
4.3	Capacity design (4.3.1 General – 4.3.2 Definition of capacity design – 4.3.3 Implementation and advantages of capacity design – 4.3.4 Levels of member strength)	56
4.4	Precast structural systems and expected response (4.4.1 General – 4.4.2 Linear response – 4.4.3 Nonlinear response and nonlinear locations – 4.4.4 Equivalent monolithic systems – 4.4.5 Jointed hybrid, jointed rotating, and jointed rocking systems – 4.4.6 Force-displacement hysteretic response)	64
4.5	Detailing for ductility (4.5.1 General – 4.5.2 Ductility provisions for overall structural behaviour – 4.5.3 Ductility provisions for members – 4.5.4 Ductility provisions for nonlinear systems – 4.5.5 Levels of ductility)	70
4.6	Demand versus capacity assessment (4.6.1 General – 4.6.2 Comparison of force-based and displacement-based design – 4.6.3 Key differences between force-based and displacement-based design – 4.6.4 Applicability of force-based and displacement-based design – 4.6.5 Aspects of force-based design – 4.6.6 Recommendations for equivalent monolithic precast systems)	76
	References	84
	Appendix A Direct Displacement-Based Design	
A.1	Overview	86
A.2	Notation	87
A.3	Procedure	88
A.4	Discussion of Displacement-Based Design	94
A.5	Recommendations for precast jointed and other systems (A.5.1 Equivalent mode shape – A.5.2 Design displacement spectra – A.5.3 Distribution of base shear force – A.5.4 Analysis for member design actions)	94
5	Lateral force resisting systems	
5.1	Introduction	97
5.2	Moment resisting frames (5.2.1 Member partitioning – 5.2.2 Classification – 5.2.3 General seismic design approaches for buildings incorporating moment resisting frame systems – 5.2.4 Design practice)	98
5.3	Structural wall and dual systems (5.3.1 Member partitioning – 5.3.2 Classification – 5.3.3 General design approaches for buildings incorporating structural wall systems – 5.3.4 Design practice – 5.3.5 Dual systems)	129
	References	159
6	Diaphragms	
6.1	Introduction	163
6.2	General concepts of diaphragm behaviour (6.2.1 Diaphragm action – 6.2.2 Standard analysis methods for diaphragm design – 6.2.3 Floor diaphragm configurations and diaphragm force paths)	163

6.3	Precast floor systems (6.3.1 General – 6.3.2 Precast concrete diaphragm construction methods – 6.3.3 Types of precast concrete floors)	164
6.4	Seating requirements for precast floor units (6.4.1 General – 6.4.2 Recommended minimum seating dimensions – 6.4.3 Tolerances – 6.4.4 Displacement compatibility – 6.4.5 Detailing for loss of support)	167
6.5	Service load effects (6.5.1 General – 6.5.2 Serviceability requirements – 6.5.3 Effect of service action on seismic behaviour)	170
6.6	Seismic design procedures for diaphragms (6.6.1 General – 6.6.2 Code approaches for diaphragm design – 6.6.3 Code design forces – 6.6.4 In-plane force analysis method)	171
6.7	Diaphragm reinforcing (6.7.1 General – 6.7.2 Mechanical connectors between precast elements – 6.7.3 Welded wire fabric – 6.7.4 Fibre concrete topping)	174
6.8	Seismic detailing of diaphragms (6.8.1 General – 6.8.2 Detailing to accommodate localized displacements – 6.8.3 Diaphragm strength limit states – 6.8.4 Detailing for web reinforcement – 6.8.5 Detailing according to strut and tie model – 6.8.6 Force transfer to vertical system – 6.8.7 Transfer diaphragms)	176
6.9	Diaphragm stiffness considerations (6.9.1 General – 6.9.2 Flexible diaphragms – 6.9.3 Stiffness of precast diaphragms – 6.9.4 Diaphragm stiffness calculations – 6.9.5 Current US code requirements for seismic drift)	181
6.10	Proposed seismic design approaches for precast diaphragms (6.10.1 General – 6.10.2 Proposed alternative approaches to precast diaphragm design – 6.10.3 Diaphragm design seismic loads – 6.10.4 Flexible diaphragms)	182

7	Gravity load resisting systems	
7.1	Introduction	191
7.2	Continuity (7.2.1 General requirements – 7.2.2 Beams)	191
7.3	Beam supports (7.3.1 General types – 7.3.2 General requirements – 7.3.3 Corbels – 7.3.4 Rocking and sliding supports – 7.3.5 Bearing – 7.3.6 Eccentricity and torsion)	192
7.4	Column connections (7.4.1 General – 7.4.2 Load paths – 7.4.3 End region rotation – 7.4.4 Shear – 7.4.5 Flexure – 7.4.6 End bearing – 7.4.7 Typical bedding details – 7.4.8 Hinges)	195
7.5	Walls (7.5.1 General – 7.5.2 Separation – 7.5.3 Gravity load resisting walls – 7.5.4 Walls not required to resist gravity loads)	197
	References	199
8	Foundations	
8.1	Introduction	201
8.2	Socket foundations (8.2.1 General – 8.2.2 Design of socket connections)	201
8.3	Pile foundations (8.3.1 Seismic design of prestressed/precast concrete piles – 8.3.2 Comparison between steam cured and autoclaved piles – 8.3.3 Flexural ductility enhancement of piles)	203
	References	205

9	Modelling and analytical methods	
9.1	Introduction	207
9.2	Alternative connection solutions (9.2.1 General – 9.2.2 Hybrid systems)	208
9.3	Alternative modelling approaches (9.3.1 Bonded or unbonded conditions – 9.3.2 Fiber element model – 9.3.3 Lumped plasticity model: moment-curvature/rotation – 9.3.4 Modelling of jointed wall systems)	210
9.4	System displacement compatibility issues (9.4.1 General – 9.4.2 Modelling of beam elongation effects – 9.4.3 Analytical modelling of precast diaphragms)	220
9.5	Analytical methods (9.5.1 General – 9.5.2 Alternative analytical methods – 9.5.3 Analytical methods and design procedures)	226

A.2	Prestressing steel	235
A.3	Bond stress-slip relationship	239
10	Miscellaneous elements and structures	
10.1	Introduction	243
10.2	Shells and folded plates	243
10.3	Stairs (10.3.1 General – 10.3.2 Detailing the supports – 10.3.3 Reinforcement details)	243
10.4	Architectural cladding panels	246
	References	247
11	Conclusions	
11.1	General	249
11.2	State of the practice in various countries	249
11.3	Advantages and disadvantages of incorporating precast concrete in construction	249
11.4	Lessons learned from previous earthquakes	249
11.5	Types of connections between precast concrete elements used in the construction of moment resisting frames and structural walls (11.3.1 Broad categories of construction – 11.3.2 Equivalent monolithic systems – 11.3.3 Jointed systems)	250
11.6	Tolerances and erection	251
11.7	Design approaches	251
11.8	Primary lateral force resisting systems (11.8.1 General – 11.8.2 Moment resisting frames – 11.8.3 Structural walls)	251
11.9	Diaphragms	253
11.10	Modelling and analytical methods	253
11.11	Gravity load resisting systems	253
11.12	Foundations	254
11.13	Miscellaneous	254
11.14	Summary	254
